

Beautiful Science, Beautiful You

Skin vitality is essential for visibly beautiful skin. New science targets the aging process by promoting a youthful-looking complexion and maintaining vitality.

Moisturisation and cell energy are the basis for the vitality and well-being of skin cells, but as our skin undergoes various stresses — pollution, environmental conditions and aging — the reserves of moisture factors fall and alter skin's appearance.

The lack of vitality and moisture in the cell implies a decrease of skin's metabolic regenerative process, diminishing structural proteins. The result is acceleration in the signs of aging, such as the appearance of wrinkles, a loss of elasticity, and a dull complexion. New advances continuously combat the aging process by helping to maintain the appearance of a youthful complexion.

Optilight Technology is a synergistic approach to promoting skin's maximum radiance and the appearance of a healthy glow. Advanced pigments work to diffuse light for a soft-focus effect, blurring imperfections as light is selectively scattered away from wrinkles, fine lines and skin discolorations to provide a flawless finish. Combining particles of various sizes with a unique blend of Swiss botanicals, the technology also imparts a "light as air" feeling while maintaining balanced moisture levels on the skin.

Arbonne Cosmetics combines Optilight Technology with luxurious formulas to create products clinically proven to allow the skin to breathe, promoting a smooth, luminous complexion for gorgeous skin and a natural, beautiful you.
